

SjurSound

pronounced "sure sound"

SjurSound divide/T

Description:

A sub-harmonic generator that gives you deep clean bass with exceptional tracking. Inspired by the many "octave divider" stomp boxes such as the MXR Bass Octave, the Boss Octave OC-2, and the Mutron Octave Divider, divide/T was created to give your sound a solid bottom end. Its unique algorithm provides exceptional tracking to let your notes ring true. With its clean sub-octave note, divide/T turns the sound of a Fender Strat into a JazzBass. Or use it to add some low-end punch and depth to your guitar. Your creative juices will flow when you divide/T.

Controls:

Normal Volume: adjusts the volume of the normal signal.

Suboctave Volume: adjusts the volume of the sub-octave signal.

Suboctave Range: adjusts the frequency (pitch) range over which the sub-octave signal will be heard. For example, set the range up full to play single notes over the entire fingerboard of the guitar. To add bass notes to finger picking styles, the range control should be set low. This control helps reduce mis-tracking when multiple notes are played.

Suboctave Tone: adjusts the tone of the sub-octave signal. With the tone set low the sub-octave signal is clean and deep. With the tone set higher, the sub-octave signal is more aggressive and has more harmonics.
